

Curriculum Summary Document

Year 10 – Computer Science

Module/Unit of Learning	Taught During	What will students learn?	How does this prepare students for success at GCSE?	Links to other Subjects
Unit 1: Computer Systems	Sept – Dec	Students study core Component 1 theory: CPU architecture, fetch-execute cycle, performance factors, embedded systems, primary and secondary storage, data units, binary/hex, image and sound representation, compression, networks and topologies, protocols, security threats, prevention methods, systems software and utility software, and legal, ethical, cultural and environmental impacts.	<p>This unit directly mirrors OCR Component 1 content, building secure foundations for exam success.</p> <p>Students gain fluency with key terminology, data-representation skills, and structured understanding of computer systems essential for progress across KS4.</p>	<p>Maths</p> <p>Science</p> <p>PSHE</p>
Programming Basics	Nov – Feb	<p>Students develop foundational Python skills including variables, inputs/outputs, data types, arithmetic/Boolean operators, sequencing, selection, iteration and writing small programs.</p> <p>They build confidence through time2code challenges and learn procedures, functions and debugging.</p>	<p>This unit strengthens the practical programming fluency required for Component 2.</p> <p>Students begin applying computational thinking, producing small working programs, and building the accuracy and resilience needed for algorithmic problem-solving.</p>	<p>Maths</p> <p>Design Technology</p>
Unit 2: Algorithms & Programming	Feb – July	<p>Students study OCR Component 2 content: algorithms, flowcharts, pseudocode, trace tables, searching and sorting algorithms, programming fundamentals, robust programming, testing, Boolean logic, languages and IDE tools.</p> <p>They apply these through structured Python development and exam-style tasks.</p>	<p>This unit prepares students for GCSE success by combining algorithmic thinking with practical coding.</p> <p>Students learn to read, write, test and refine algorithms, apply exam-reference language, and develop robust solutions aligned to Component 2 requirements.</p>	<p>Maths</p> <p>Science</p>
